Watching

Typhoons

Typhoon No. 29 (Koguma) is passing well east of Japan today and becomes an ordinary low by Wed 14. No other systems are forecast toward Japan or Hong Kong. Hong Kong's season usually winds down by the end of October.

How much rain is that

Under 1 mm
Likely dry, a few spits at most.

1 to 5 mm
Light rain. Umbrella, carry on.

5 to 15 mm
Steady rain. Wet shoes, views gone.

Over 15 mm
Heavy. Move outdoor plans.

Chance and amount

The percentage is the chance of at least 1 mm of rain in that time. The millimetres are the single most likely amount. So 40% with under 1 mm means probably dry, with a fair chance of a light shower.

How sure is each day

Firm	Within 5 days. Plan on it.
Fair	6 to 10 days. The pattern is right, the timing of rain can shift a day.
Outlook	11 days or more. A trend from long-range models, not a forecast. Don't move anything yet.

How the forecasts are combined

Each day gets one combined rain chance, a weighted average of the sources that reach it. tenki.jp carries the most weight. Its figures also drive the time-of-day charts and millimetres. The others are there to confirm or flag a split.

UP TO 7 DAYS OUT

tenki.jp 30%

Best at catching rain, hourly timing and temperature. Can over-call rain

JMA (official) 25%

Fewest false alarms. Its 7-day forecast only

Weathernews 25%

Ranked most accurate by Tokyo Shoko Research, 2022 to 2024

Global model 15%

Millimetres by time of day

AccuWeather 5%

Text only, no percentages

8 DAYS AND BEYOND

tenki.jp 30%

Weathernews 30%

Global model 25%

The strongest medium-range model

AccuWeather 15%

Where tenki.jp gives 6-hour blocks, its chance is the highest block between 06:00 and midnight, so rain overnight before you're up doesn't count against the day.

The Global Forecasting Model's millimetres and AccuWeather's wording are turned into a chance: dry 10%, a stray shower 35%, showers or a little rain 50%, rain 70 to 75%, heavy rain 85%.

When tenki.jp alone calls rain, it's flagged as a split and read as possible, not likely. It catches nearly all real rain but also calls rain that doesn't come.

Temperatures come from tenki.jp, which beat JMA on temperature error at every range out to 7 days.

In Hong Kong the Hong Kong Observatory will lead once its 9-day forecast reaches the trip. Google and Apple Weather can't be read from here.

THE EVIDENCE

tenki.jp forecast accuracy reports. Quarterly, rain and hourly accuracy against JMA

Japan Weather Association accuracy, Oct to Dec 2025. 88 to 92% same-day rain, hourly 6 points above JMA, lower temperature error

Weathernews accuracy 2024. 88% hit rate, top for 3 years in a Tokyo Shoko Research ranking. Self-reported

Independent check of five forecasters, Aug 2025. tenki.jp caught 95.5% of rain days, most of any, but had the most false alarms. JMA most precise

Comparison of the Japanese services, Sep 2026. JMA, Weathernews and tenki.jp all about 85 to 90% next day. Compare two, and treat a split as a hard call

Checked Tue 13 Oct, 20:55 Melbourne time. tenki.jp's Shibuya page served an older issue this check, so Tokyo uses tenki.jp's Chiyoda forecast (the next ward, which covers Hibiya), issued 07:00 Tue 13.
